Statistical Tests on the Mental Model Difficulty Ratings

Required Packages

```r
library(ggplot2)
library(haven)
library(easyGgplot2)
library(tidyr)
library(coin)
```

```
## Loading required package: survival
```

Extracting Mental Models

```r
ourdf <- read.csv('our_mmq_ratings.csv')
ourdf <- ourdf[, -which(names(ourdf) == "Question.Text")]
ourdf <- ourdf[, -which(names(ourdf) == "Question.Number")]

gcsdf <- read.csv('gcs_mmq_ratings.csv')
gcsdf <- gcsdf[, -which(names(gcsdf) == "Question.Text")]
gcsdf <- gcsdf[, -which(names(gcsdf) == "Question.Number")]

dhdf <- read.csv('datahub_mmq_ratings.csv')
dhdf <- dhdf[, -which(names(dhdf) == "Question.Text")]
dhdf <- dhdf[, -which(names(dhdf) == "Question.Number")]
```

Carrying out the Mann-Whitney U Test

```r
our_wilcox_tests <- function(n){
  our_n <- as.numeric(ourdf[n,])
  gcs_n <- as.numeric(gcsdf[n,])
  datahub_n <- as.numeric(dhdf[n,])

  our_vals <- c()
  gcs_vals <- c()
  datahub_vals <- c()
  for (i in 1:5){
    our_times <- our_n[i]
    our_vals <- append(our_vals, rep(i, our_times)); our_vals
    gcs_times <- gcs_n[i]
    gcs_vals <- append(gcs_vals, rep(i, gcs_times)); gcs_vals
    datahub_times <- datahub_n[i]
    datahub_vals <- append(datahub_vals, rep(i, datahub_times)); datahub_vals
  }
  #One-Sided Mann-Whitney U Significance Test for Whether our Median is Less
  #than that of the other mental model's
  w1 <- wilcox.test(our_vals, gcs_vals, alternative = "less")
```

```
  w2 <- wilcox.test(our_vals, datahub_vals, alternative = "less")

  print("Our KR vs GCS KR")
  print(w1)
  print("Our KR vs Datahub KR")
  print(w2)
}
```

```
our_wilcox_tests(1)
```

```
